Supplementary Material

A Definitions

We describe the formal notation of derivations of the propensity estimation and the potential outcome predictions.

DEFINITION A.1. We represent the multiplicative deviations of the propensity score estimation as:

\[(A.1) \quad \delta_i^{(1)} = 1 - \frac{e(X_i)}{\hat{e}(X_i)} \]
\[(A.2) \quad \delta_i^{(0)} = 1 - \frac{1 - e(X_i)}{1 - \hat{e}(X_i)} \]

If we have a perfect propensity score estimator (i.e., $\hat{e}(X_i) = e(X_i)$), $\delta_i^{(1)} = \delta_i^{(0)} = 0$. With regard to (A.1) and (A.2), the following equation holds.

\[(A.3) \quad \delta_i^{(0)} = -\frac{\hat{e}(X_i)}{1 - \hat{e}(X_i)} \delta_i^{(1)} \]

DEFINITION A.2. The additive deviations of the potential outcome models are represented as:

\[(A.4) \quad \Delta_i^{(1)} = \hat{\mu}_i^{(1)} - \mu_i^{(1)} \]
\[(A.5) \quad \Delta_i^{(0)} = \hat{\mu}_i^{(0)} - \mu_i^{(0)} \]

where $\hat{\mu}_i^{(1)}$ and $\hat{\mu}_i^{(0)}$ are predicted values for the expectations of $i$'s potential outcomes.

DEFINITION A.3. $\hat{Y}_i^{DR}$ is decomposed as:

\[(A.6) \quad \hat{Y}_i^{DR} = \hat{Y}_i^{DR}(1) - \hat{Y}_i^{DR}(0) \]

where

\[
\hat{Y}_i^{DR}(1) = \frac{W_i}{\hat{e}(X_i)} (Y_{i}^{obs} - \hat{\mu}_i^{(1)}) + \hat{\mu}_i^{(1)} \\
\hat{Y}_i^{DR}(0) = \frac{1 - W_i}{1 - \hat{e}(X_i)} (Y_{i}^{obs} - \hat{\mu}_i^{(0)}) + \hat{\mu}_i^{(0)}
\]

B Proof of Theorem 3.3 and 3.4

First, we show the following Lemma B.1.

LEMMA B.1. The covariance of $\hat{Y}_i^{DR}(1)$ and $\hat{Y}_i^{DR}(0)$ is

\[(B.7) \quad Cov\left(\hat{Y}_i^{DR}(1),\hat{Y}_i^{DR}(0) \middle| X_i\right) = -\frac{e(X_i)(1 - e(X_i))}{\hat{e}(X_i)(1 - \hat{e}(X_i))} \Delta_i^{(1)} \Delta_i^{(0)} \]

Proof. The covariance is decomposed as:

\[(B.8) \quad Cov\left(\hat{Y}_i^{DR}(1),\hat{Y}_i^{DR}(0) \middle| X_i\right) = \mathbb{E}\left[\hat{Y}_i^{DR}(1)\hat{Y}_i^{DR}(0) \middle| X_i\right] - \mathbb{E}\left[\hat{Y}_i^{DR}(1) \middle| X_i\right] \mathbb{E}\left[\hat{Y}_i^{DR}(0) \middle| X_i\right] \]

The first term of (B.8):

\[E\left[\hat{Y}_i^{DR}(1)\hat{Y}_i^{DR}(0) \middle| X_i\right] = E\left[\frac{W_i}{\hat{e}(X_i)} (Y_{i}^{obs} - \hat{\mu}_i^{(1)}) + \hat{\mu}_i^{(1)} \right. \]
\[
\left. \left(1 - W_i \right) \left(1 - \hat{e}(X_i)\right) (Y_{i}^{obs} - \hat{\mu}_i^{(0)}) + \hat{\mu}_i^{(0)} \middle| X_i\right] \]
\[
= E\left[\frac{W_i}{\hat{e}(X_i)} \right. \left. \frac{1}{X_i} \mathbb{E}\left[\left(Y_{i}^{(1)} - \hat{\mu}_i^{(1)}\right) \hat{\mu}_i^{(0)} \middle| X_i\right] \right]
\]
\[
+ E\left[\left(1 - W_i \right) \left(1 - \hat{e}(X_i)\right) \mathbb{E}\left[\left(Y_{i}^{(0)} - \hat{\mu}_i^{(0)}\right) \hat{\mu}_i^{(1)} \middle| X_i\right] + \hat{\mu}_i^{(1)} \hat{\mu}_i^{(0)} \right]
\]
\[= \frac{e(X_i)}{\hat{e}(X_i)} \hat{\mu}_i^{(1)} - \frac{e(X_i)}{\hat{e}(X_i)} \hat{\mu}_i^{(1)} \hat{\mu}_i^{(0)}
\]
\[+ \left(1 - e(X_i)\right) \hat{\mu}_i^{(1)} - \left(1 - e(X_i)\right) \hat{\mu}_i^{(1)} \hat{\mu}_i^{(0)}
\]
\[= \left(1 - \delta_i^{(1)}\right) \hat{\mu}_i^{(0)} - \left(1 - \delta_i^{(0)}\right) \hat{\mu}_i^{(1)}
\]

The second term of (B.8):

\[E\left[\hat{Y}_i^{DR}(1) \middle| X_i\right] = \mathbb{E}\left[\hat{Y}_i^{DR}(0) \middle| X_i\right] \]
\[= \left(\Delta_i^{(1)} \delta_i^{(1)} + \mu_i^{(0)}\right) \left(\Delta_i^{(0)} \delta_i^{(0)} + \mu_i^{(0)}\right) \quad \text{: Theorem 3.3}
\]
\[= \left(1 - \delta_i^{(1)}\right) \left(1 - \delta_i^{(0)}\right) \mu_i^{(1)} \mu_i^{(0)} + \delta_i^{(1)} \left(1 - \delta_i^{(0)}\right) \hat{\mu}_i^{(1)} \mu_i^{(0)} + \left(1 - \delta_i^{(1)}\right) \delta_i^{(0)} \mu_i^{(1)} \mu_i^{(0)}
\]

Combining (B.8), (B.9), and (B.10), we have:

\[Cov\left(\hat{Y}_i^{DR}(1),\hat{Y}_i^{DR}(0) \middle| X_i\right) = E\left[\hat{Y}_i^{DR}(1)\hat{Y}_i^{DR}(0) \middle| X_i\right] - E\left[\hat{Y}_i^{DR}(1) \middle| X_i\right] E\left[\hat{Y}_i^{DR}(0) \middle| X_i\right]
\]
\[= \left(1 - \delta_i^{(1)}\right) \mu_i^{(1)} \mu_i^{(0)} - \left(1 - \delta_i^{(1)} - \delta_i^{(0)}\right) \mu_i^{(1)} \mu_i^{(0)}
\]
\[+ \left(1 - \delta_i^{(0)}\right) \mu_i^{(1)} \mu_i^{(0)} - \left(1 - \delta_i^{(1)}\right) \left(1 - \delta_i^{(0)}\right) \mu_i^{(1)} \mu_i^{(0)}
\]
\[= -\delta_i^{(1)} \left(1 - \delta_i^{(0)}\right) \mu_i^{(1)} \mu_i^{(0)} + \left(1 - \delta_i^{(0)}\right) \delta_i^{(1)} \mu_i^{(1)} \mu_i^{(0)} - \delta_i^{(1)} \delta_i^{(0)} \mu_i^{(1)} \mu_i^{(0)}
\]
\[= -\left(1 - \delta_i^{(1)}\right) \left(1 - \delta_i^{(0)}\right) \mu_i^{(1)} \mu_i^{(0)}
\]
\[= -\delta_i^{(1)} \left(1 - \delta_i^{(0)}\right) \mu_i^{(1)} \mu_i^{(0)}
\]
\[= -\frac{e(X_i)(1 - e(X_i))}{\hat{e}(X_i)(1 - \hat{e}(X_i))} \Delta_i^{(1)} \Delta_i^{(0)}
\]

Theorem 3.3. The bias of $\hat{Y}_{i}^{DR}$ is

$$\text{Bias}\left(\hat{Y}_{i}^{DR} \mid X_{i}\right) = \left|\mathbb{E}\left[\hat{Y}_{i}^{DR} \mid X_{i}\right] - \tau_{i}\right|$$

(B.11)

Proof. The expectation of the first term of (A.6) is

(E) \[ E\left[\hat{Y}_{i}^{DR}(1) \mid X_{i}\right] \]
\[ = E\left[\frac{W_{i}}{\hat{e}(X_{i})}\left(Y_{i}^{\text{obs}} - \hat{\mu}_{i}^{(1)}\right) + \hat{\mu}_{i}^{(1)} \mid X_{i}\right] \]
\[ = E\left[\hat{\mu}_{i}^{(1)} - Y_{i}^{(1)} \left(1 - \frac{W_{i}}{\hat{e}(X_{i})}\right) + Y_{i}^{(1)} \mid X_{i}\right] \]
\[ = E\left[\hat{\mu}_{i}^{(1)} - Y_{i}^{(1)} \mid X_{i}\right] E\left[1 - \frac{W_{i}}{\hat{e}(X_{i})} \mid X_{i}\right] + E\left[Y_{i}^{(1)} \mid X_{i}\right] \]
\[ = \left(\hat{\mu}_{i}^{(1)} - \mu_{i}^{(1)}\right) \left(1 - \frac{e(X_{i})}{\hat{e}(X_{i})}\right) + \mu_{i}^{(1)} \]
\[ = \Delta_{i}^{(1)} \delta_{i}^{(1)} + \mu_{i}^{(1)} \]

Similarly, we obtain

\[ E\left[\hat{Y}_{i}^{DR}(0) \mid X_{i}\right] = \Delta_{i}^{(0)} \delta_{i}^{(0)} + \mu_{i}^{(0)} \]

We have (B.11) by (A.3), (B.12), and (B.13).

\[ \square \]

Theorem 3.4. The variance of $\hat{Y}_{i}^{DR}$ is

(B.14)

$$\text{Var}\left(\hat{Y}_{i}^{DR} \mid X_{i}\right) = E\left[\epsilon_{i}^{(1)}\right]^2 \mid X_{i}\right] + E\left[\epsilon_{i}^{(0)}\right]^2 \mid X_{i}\right] \]
\[ + \frac{1 - e(X_{i})}{e(X_{i})} \left(\Delta_{i}^{(1)}\right)^2 \left(1 - \delta_{i}^{(1)}\right)^2 \]
\[ + \frac{e(X_{i})}{1 - e(X_{i})} \left(\Delta_{i}^{(0)}\right)^2 \left(1 - \delta_{i}^{(0)}\right)^2 \]
\[ + \frac{2e(X_{i})(1 - e(X_{i}))}{e(X_{i})(1 - e(X_{i}))} \Delta_{i}^{(1)} \Delta_{i}^{(0)} \]

Proof. The second moment of the first term of (A.6) is

(E) \[ E\left[\hat{Y}_{i}^{DR}(1)^2 \mid X_{i}\right] \]
\[ = E\left[\left(\hat{\mu}_{i}^{(1)} - Y_{i}^{(1)}\right) \left(1 - \frac{W_{i}}{\hat{e}(X_{i})}\right) + Y_{i}^{(1)}\right]^2 \mid X_{i}\right] \]
\[ = E\left[\left(\Delta_{i}^{(1)}\right)^2 \left(1 - \frac{W_{i}}{\hat{e}(X_{i})}\right) + \mu_{i}^{(1)} + \epsilon_{i}^{(1)}\right]^2 \mid X_{i}\right] \]
\[ = E\left[\epsilon_{i}^{(1)}\right]^2 \mid X_{i}\right] + 2E\left[\mu_{i}^{(1)} \Delta_{i}^{(1)} \left(1 - \frac{W_{i}}{\hat{e}(X_{i})}\right) \mid X_{i}\right] \]
\[ + E\left[\left(\Delta_{i}^{(1)}\right)^2 \left(1 - \frac{2W_{i}}{\hat{e}(X_{i})} + \frac{W_{i}}{\hat{e}(X_{i})}\right) \mid X_{i}\right] + \left(\mu_{i}^{(1)}\right)^2 \]
\[ + \frac{1 - e(X_{i})}{e(X_{i})} \left(\epsilon_{i}^{(1)}\right)^2 \mid X_{i}\right] + 2\mu_{i}^{(1)} \Delta_{i}^{(1)} \delta_{i}^{(1)} \]
\[ + \left(\Delta_{i}^{(1)}\right)^2 \left(\frac{\epsilon_{i}^{(1)}\left(\epsilon_{i}^{(1)}\right)^2 + e(X_{i})}{\left(\hat{e}(X_{i})\right)^2}\left(1 - e(X_{i})\right)\right) + \left(\mu_{i}^{(1)}\right)^2 \]
\[ = E\left[\epsilon_{i}^{(1)}\right]^2 \mid X_{i}\right] + \mu_{i}^{(1)} + \Delta_{i}^{(1)} \delta_{i}^{(1)} \]
\[ + \frac{1 - e(X_{i})}{e(X_{i})} \left(\Delta_{i}^{(1)}\right)^2 \left(1 - \delta_{i}^{(1)}\right)^2 \]
\[ + \frac{1 - e(X_{i})}{e(X_{i})} \left(\epsilon_{i}^{(1)}\right)^2 \mid X_{i}\right] + \mu_{i}^{(1)} + \Delta_{i}^{(1)} \delta_{i}^{(1)} \]
\[ + \frac{1 - e(X_{i})}{e(X_{i})} \left(\Delta_{i}^{(1)}\right)^2 \left(1 - \delta_{i}^{(1)}\right)^2 \]

Therefore the variance is

(B.15)

$$\text{Var}\left(\hat{Y}_{i}^{DR} \mid X_{i}\right) = \left(E\left[\hat{Y}_{i}^{DR}(1) \mid X_{i}\right] - E\left[\hat{Y}_{i}^{DR}(0) \mid X_{i}\right]\right)^2$$

$$= E\left[\epsilon_{i}^{(1)}\right]^2 \mid X_{i}\right] + \frac{1 - e(X_{i})}{e(X_{i})} \left(\Delta_{i}^{(1)}\right)^2 \left(1 - \delta_{i}^{(1)}\right)^2$$

Similarly, we obtain

(B.16)

$$\text{Var}\left(\hat{Y}_{i}^{DR}(0) \mid X_{i}\right) = E\left[\epsilon_{i}^{(0)}\right]^2 \mid X_{i}\right] + \frac{e(X_{i})}{1 - e(X_{i})} \left(\Delta_{i}^{(0)}\right)^2 \left(1 - \delta_{i}^{(0)}\right)^2$$

Finally, we have by (B.15) and (B.16), and Lemma B.1 that:

$$\text{Var}\left(\hat{Y}_{i}^{DR} \mid X_{i}\right)$$
\[ = \text{Var}\left(\hat{Y}_{i}^{DR}(1) \mid X_{i}\right) + \text{Var}\left(\hat{Y}_{i}^{DR}(0) \mid X_{i}\right) \]
\[ - 2\text{Cov}\left(\hat{Y}_{i}^{DR}(1), \hat{Y}_{i}^{DR}(0) \mid X_{i}\right) \]
\[ = \left(E\left[\epsilon_{i}^{(1)}\right]^2 \mid X_{i}\right] + E\left[\epsilon_{i}^{(0)}\right]^2 \mid X_{i}\right] \]
\[ + \frac{1 - e(X_{i})}{e(X_{i})} \left(\Delta_{i}^{(1)}\right)^2 \left(1 - \delta_{i}^{(1)}\right)^2 \]
\[ + \frac{e(X_{i})}{1 - e(X_{i})} \left(\Delta_{i}^{(0)}\right)^2 \left(1 - \delta_{i}^{(0)}\right)^2 \]
\[ + \frac{2e(X_{i})(1 - e(X_{i}))}{e(X_{i})(1 - e(X_{i}))} \Delta_{i}^{(1)} \Delta_{i}^{(0)} \]

\[ \square \]
C Proof of Theorem 3.1 and 3.2

**Theorem 3.1.** The bias of the transformed outcome with a biased propensity score is

\[
\text{Bias} \left( \hat{Y}_i^{TO} \mid \mathbf{X}_i \right) = \left| \mathbb{E} \left[ \hat{Y}_i^{TO} \mid \mathbf{X}_i \right] - \tau_i \right| \\
(C.17) = \left| \delta_i^{(1)} \left( \mu_i^{(1)} + \frac{\hat{e}(\mathbf{X}_i)}{1 - \hat{e}(\mathbf{X}_i)} \mu_i^{(0)} \right) \right|
\]

**Proof.** We have (C.17) by replacing \( \Delta_i^{(1)} \) and \( \Delta_i^{(0)} \) in (B.11) with \( \mu_i^{(1)} \) and \( \mu_i^{(0)} \) respectively.

**Theorem 3.2.** The variance of the transformed outcome with a biased propensity score is

\[
\text{Var} \left( \hat{Y}_i^{TO} \mid \mathbf{X}_i \right) = \mathbb{E} \left[ (\epsilon_i^{(1)})^2 \mid \mathbf{X}_i \right] + \mathbb{E} \left[ (\epsilon_i^{(0)})^2 \mid \mathbf{X}_i \right] + \frac{1 - e(\mathbf{X}_i)}{e(\mathbf{X}_i)} \left( \mu_i^{(1)} \right)^2 \left( 1 - \delta_i^{(1)} \right)^2 + \frac{e(\mathbf{X}_i)}{1 - e(\mathbf{X}_i)} \left( \mu_i^{(0)} \right)^2 \left( 1 - \delta_i^{(0)} \right)^2 + \frac{2e(\mathbf{X}_i)(1 - e(\mathbf{X}_i))}{e(\mathbf{X}_i)(1 - e(\mathbf{X}_i))} \mu_i^{(1)} \mu_i^{(0)}
\]

**Proof.** We have (C.18) by replacing \( \Delta_i^{(1)} \) and \( \Delta_i^{(0)} \) in (B.14) with \( \mu_i^{(1)} \) and \( \mu_i^{(0)} \) respectively.

D Proof of Theorem 3.5

**Theorem 3.5.** Given a set of realized training dataset \( \{ \mathbf{x}_i, w_i, y_i^{obs} \} \), and suppose \( \zeta_i = 0 \), the bias and variance of \( \hat{Y}_i^{SDR}(\gamma) \) are

\[
(D.19) \quad \text{Bias} \left( \hat{Y}_i^{SDR}(\gamma) \mid \zeta_i = 0 \right) = \left| \Delta_i^{(1)} - \Delta_i^{(0)} \right|
\]

\[
(D.20) \quad \text{Var} \left( \hat{Y}_i^{SDR}(\gamma) \mid \zeta_i = 0 \right) = 0
\]

**Proof.** Suppose \( \zeta_i = 0 \), then,

\[
\hat{Y}_i^{SDR}(\gamma) = \hat{\mu}_i^{(1)} - \hat{\mu}_i^{(0)}
\]

Therefore, by simply subtracting \( i \)'s true ITE from both sides, we have:

\[
\text{Bias} \left( \hat{Y}_i^{SDR}(\gamma) \mid \zeta_i = 0 \right) = \left| \mathbb{E} \left[ \hat{Y}_i^{SDR}(\gamma) \mid \zeta_i = 0 \right] - \tau_i \right| = \left| (\hat{\mu}_i^{(1)} - \hat{\mu}_i^{(0)}) - (\mu_i^{(1)} - \mu_i^{(0)}) \right| = \left| \Delta_i^{(1)} - \Delta_i^{(0)} \right|
\]

As for the variance, when \( i \)'s feature vector is given, \( \hat{Y}_i^{SDR}(\gamma) = \hat{\mu}_i^{(1)} - \hat{\mu}_i^{(0)} \) is a constant value. Therefore, (D.20) holds.

E Proof of Theorem 4.1 and 4.2

First, we prove Theorem 4.2 and use it to prove Theorem 4.1.

**Theorem 4.2.** The bias of SDR-MSE with \( \gamma = 0 \) from the true MSE is

\[
(E.21) \quad \left| \mathbb{E} \left[ \left( \hat{Y}_i^{SDR}(0) - \hat{\tau}_i \right)^2 \right] - \mathbb{E} \left[ (\tau_i - \hat{\tau}_i)^2 \right] \right|
\]

**Proof.** We have:

\[
\begin{align*}
&= \mathbb{E} \left[ \left( \hat{Y}_i^{SDR}(0) - \tau_i + \tau_i - \hat{\tau}_i \right)^2 \right] \\
&= \mathbb{E} \left[ \left( \hat{Y}_i^{SDR}(0) - \tau_i \right)^2 \right] + \mathbb{E} \left[ (\tau_i - \hat{\tau}_i)^2 \right] + 2 \mathbb{E} \left[ (\tau_i - \hat{\tau}_i) \mathbb{E} \left[ \hat{Y}_i^{SDR}(\gamma = 0) - \tau_i \mid \mathbf{X}_i \right] \right] \\
&= \mathbb{E} \left[ \left( \hat{Y}_i^{SDR}(0) - \tau_i \right)^2 \right] + \mathbb{E} \left[ (\tau_i - \hat{\tau}_i)^2 \right] + 2 \mathbb{E} \left[ \delta_i^{(1)} (\hat{\tau}_i - \tau_i) \left( \Delta_i^{(1)} + \frac{\hat{e}(\mathbf{X}_i)}{1 - \hat{e}(\mathbf{X}_i)} \Delta_i^{(0)} \right) \right]
\end{align*}
\]

Therefore, by subtracting \( \mathbb{E} \left[ (\tau_i - \hat{\tau}_i)^2 \right] \) from both sides, we have (E.21).

**Theorem 4.1.** The bias of TO-MSE from the true MSE is

\[
(E.22) \quad \left| \mathbb{E} \left[ \left( \hat{Y}_i^{TO} - \hat{\tau}_i \right)^2 \right] - \mathbb{E} \left[ (\tau_i - \hat{\tau}_i)^2 \right] \right|
\]

**Proof.** We have (E.22) by replacing \( \Delta_i^{(1)} \) and \( \Delta_i^{(0)} \) in (E.21) with \( \mu_i^{(1)} \) and \( \mu_i^{(0)} \) respectively.
F Details of the Experiments

F.1 Synthetic Data Here we present the details of parameter tuning in Section 5.1.

![Diagram](image)

Figure 8: Overall flow of the experiments. Red box: meta-learning methods experiment. Blue box: evaluation metrics experiment.

F.1.1 Details of the Base Models: We used the same 50 base models in Section 5.1.1 and 5.1.2.

- **Elastic Net**: 20 base models were based on Elastic Net. The regularization parameter $\alpha$ was between 0.01 and 1, and the ratio of the L1 regularization term $\lambda_1$ was between 0.01 and 0.9.

- **GBR**: 30 base models were based on GBR. The number of boosting stages $n_{trees}$ was between 50 and 400. The maximum depth of the individual regression estimators $\Delta_{depth}$ was 2 or 4. The rate that shrinks the contribution of each tree $\eta$ was 0.1 or 0.2.

F.1.2 Parameter Tuning Procedures for Outcome Models: Here, we describe the model selection and the hyper-parameter tuning procedures for the Potential Outcome Models (POMs) used in our proposed methods and the Observed Outcome Models (OOMs) used in $\tau$-risk$_R$. Note that we only used the observed outcome, feature vectors, and treatment assignments, i.e., $(X_i, W_i, y_i^{obs})$, because these are available in real-world settings.

For the POM selection, we used $\mu$-risk [19]. We selected the model and the corresponding hyper-parameters that minimized $\mu$-risk as POM for each scenario. For the OOM selection, we selected the model and the corresponding hyper-parameters that had the minimum MSE for the observed outcomes. We relied on 3-fold cross-validation for the model selections, and used 3,000 samples from the first iteration of the experiments. Table F.1 lists the resulting POMs and OOMs for each scenario.

G Right Heart Catheterization Data

Here we present the details of parameter tuning in Section 5.2.

G.1 Details of the Base Models: We used 20 base models for each meta-learning method.

For TMA:

- **Logistic Regression**: 10 base models were Logistic Regression. The Regularization parameter $\alpha$ was between 0.01 and 500.

- **RFC**: 10 base models were RFC. The number of trees was fixed ($n_{trees} = 300$), the maximum depth of the tree $\Delta_{depth}$ was between 1 and 5, the minimum number of samples required to be at a leaf node $n_{min-leaf}$ was 1 or 3.

For TOM & SDRM:

- **Elastic Net**: 10 base models were Elastic Net. The regularization parameter $\alpha$ was between 0.01 and

G.2 Details of the POM and OOM: We followed the same procedures as in F.1.2. Table G.4 lists the selected POM and OOM.

G.3 Full Results Table G.5 lists the complete result of the experiment on the RHC dataset in Section 5.2.

10, and the ratio of the L1 regularization term $\lambda_1$ was between 0.01 and 0.9.

**RFR:** 10 base models were RFRs. The number of trees was fixed ($n_{trees} = 300$), the maximum depth of the tree $\Delta_{depth}$ was between 1 and 5, the minimum number of samples required to be at a leaf node $n_{min-leaf}$ was 1 or 3.
